

# DigiSOL DS1000 Crystal Clear

## Glazing enhancement

Thank you for choosing DS1000 Crystal Clear for your glazing enhancement installation. Our reputation for excellence is built upon a commitment to producing films of the highest quality. Please read the notes below to familiarise yourself with details of the film drying time and subsequent care and maintenance.

-----

### Film drying time

The installation of glazing enhancement uses a water-based solution to ensure the films slide into position with ease; this solution takes time to dry. Drying time can be anything up to 30 days and varies according to the ambient temperature, exposure to sunlight and film thickness. During this period, the appearance of small water beads and/or slight cloudiness is completely normal. If after 30 days you have any concerns with the appearance of your glazing enhancement, please contact your installer.

-----

### Care and maintenance

Please do not attempt to clean the glazing enhancement films within 30 days of installation as doing so may compromise the adhesion and curing process.

Subsequently, the films can be cleaned in the same way as ordinary glass surfaces, using soft cloths and proprietary window cleaning liquids. To avoid scratching or impairing the appearance of the films, DO NOT use abrasive materials, solutions or tools for cleaning or drying.
